

CELLULITE PREVENTION AND TREATMENT

Reduce dimpling • Improve microcirculation

- **Prevents cellulite formation and diminishes existing cellulite**
- **Dual anti-cellulite approach: inhibits adipocyte maturation and improves microcirculation**
- **Guaranteed visible results in 30 days**
- **Paraben Free**

6 OZ. Bottle

MSRP \$69.95 ea.

Pregnancy and new motherhood is difficult enough – you shouldn't have to feel uncomfortable in your own skin. Unfortunately, many women do. The problem isn't weight gained during pregnancy; it's the stubborn effects of the weight gain and/or weight loss. Cellulite is the scourge that affects new moms and veteran mommies alike.

Regardless of your age, fitness level, or heritage, cellulite is a common side effect of pregnancy. Cellulite occurs predominantly in women (80 to 95% of women, regardless of weight) because of underlying physiological aspects, such as naturally higher levels of adipose tissue and various female hormones (i.e., estrogen). Pregnancy can exacerbate these underlying factors, promoting cellulite's formation.

Cellulite Prevention and Repair

Fortunately, how cellulite forms, what physical and hormonal changes trigger its occurrence, and the methods for preventing or reversing its appearance are well understood today. Medically, cellulite is a condition of poor microcirculation that causes damage to the fat tissue under the skin, creating leakage of fluids into surrounding tissues; plus accumulation of cellular by-products (i.e., triglycerides, adipocytes, toxins), which leads to swelling

and congestion in tissue that causes damage to elastin and collagen. The final result is the formation of cellulite nodules - the dimpled, orange-peel looking skin. If these processes are interrupted and/or reversed, the affected part of the body will naturally heal itself and see a marked improvement in the skin's appearance.

Robelyn's Cellulite Prevention & Treatment includes clinically proven anti-cellulite ingredients

Our advanced skin care formula has shown dermatological benefits when applied topically to cellulite-affected skin. The combination of soothing emollients, hydrating agents, and an advanced peptide complex produces dramatic improvements in alleviating and correcting the appearance of cellulite damage. In vivo testing of our peptide complex produced a size reduction in buttock and thigh circumference, decreased extracellular water, significant decreased body fat mass, improved skin moisture, and better skin elasticity after only 30 days, and greater results after 60 days.

The pro-liposomal effect of our peptide complex helps to scavenge cellular detritus while improving microcirculation and inhibiting adipocyte maturation. The result – cellulite formation is prevented and existing cellulite is markedly and visibly reduced.
